并发与异步(二)

POWERED BY STITIBLE

- •Future在rust中是惰性的
- •async在rust中没有开销
- •rust并不是默认自带异步运行时
- •运行时同时支持单线程和多线程

Rust的Stream

Stream 特征类似于 Future 特征,但是前者在完成前可以生成多个值,这种行为跟标准库中的 Iterator 特征倒是颇为相似。

```
trait Stream {
    type Item;
    fn poll_next(self: Pin<&mut Self>, cx: &mut Context<'_>)
     -> Poll<Option<Self::Item>>;
}
```

Stream的并发

```
stream.for_each_concurrent(MAX_CONCURRENT_JUMPERS, |num| async
move {
    jump_n_times(num).await?;
    report_n_jumps(num).await?;
    Ok(())
}).await?;
```

自引用类型

```
struct SelfRef {value: String,pointer_to_value: *mut String,}
```

异步中的自引用

```
async {
let mut x = [0; 128];
let read_into_buf_fut = read_into_buf(&mut x);
read_into_buf_fut.await;
println!("{:?}", x);
}
```

异步中的自引用

```
struct ReadIntoBuf<'a> {
   buf: &'a mut [u8], // 指向下面的`x`字段
struct AsyncFuture {
   x: [u8; 128],
   read_into_buf_fut: ReadIntoBuf<'what_lifetime?>,
```

Q&A
